

## Storming Images New Product Announcement:

### The Remote Media Manager:

Storming Images created a unique flexible product that controls digital media trafficking, and playback at any local or remote facility within a digital display network. *The "Remote Media Manager" and our Admachine Hardware* allows the playback of any digital media on virtually any type of display device (Plasma, LCD, Projector, Outdoor LED Displays, etc.) at any location.

From any web browser connected to the Internet, you can securely access the Remote Media Manager enabling local or remote control of your digital display network. The Remote Media Manager has four roles that can be assigned to maximize your ability to run and expand your network. The Location Manager is responsible for granting access to the system, and reviewing and implementing all media requests. Additional user roles are assigned to incorporate a workflow process that facilitates management of small to large-scale networks.

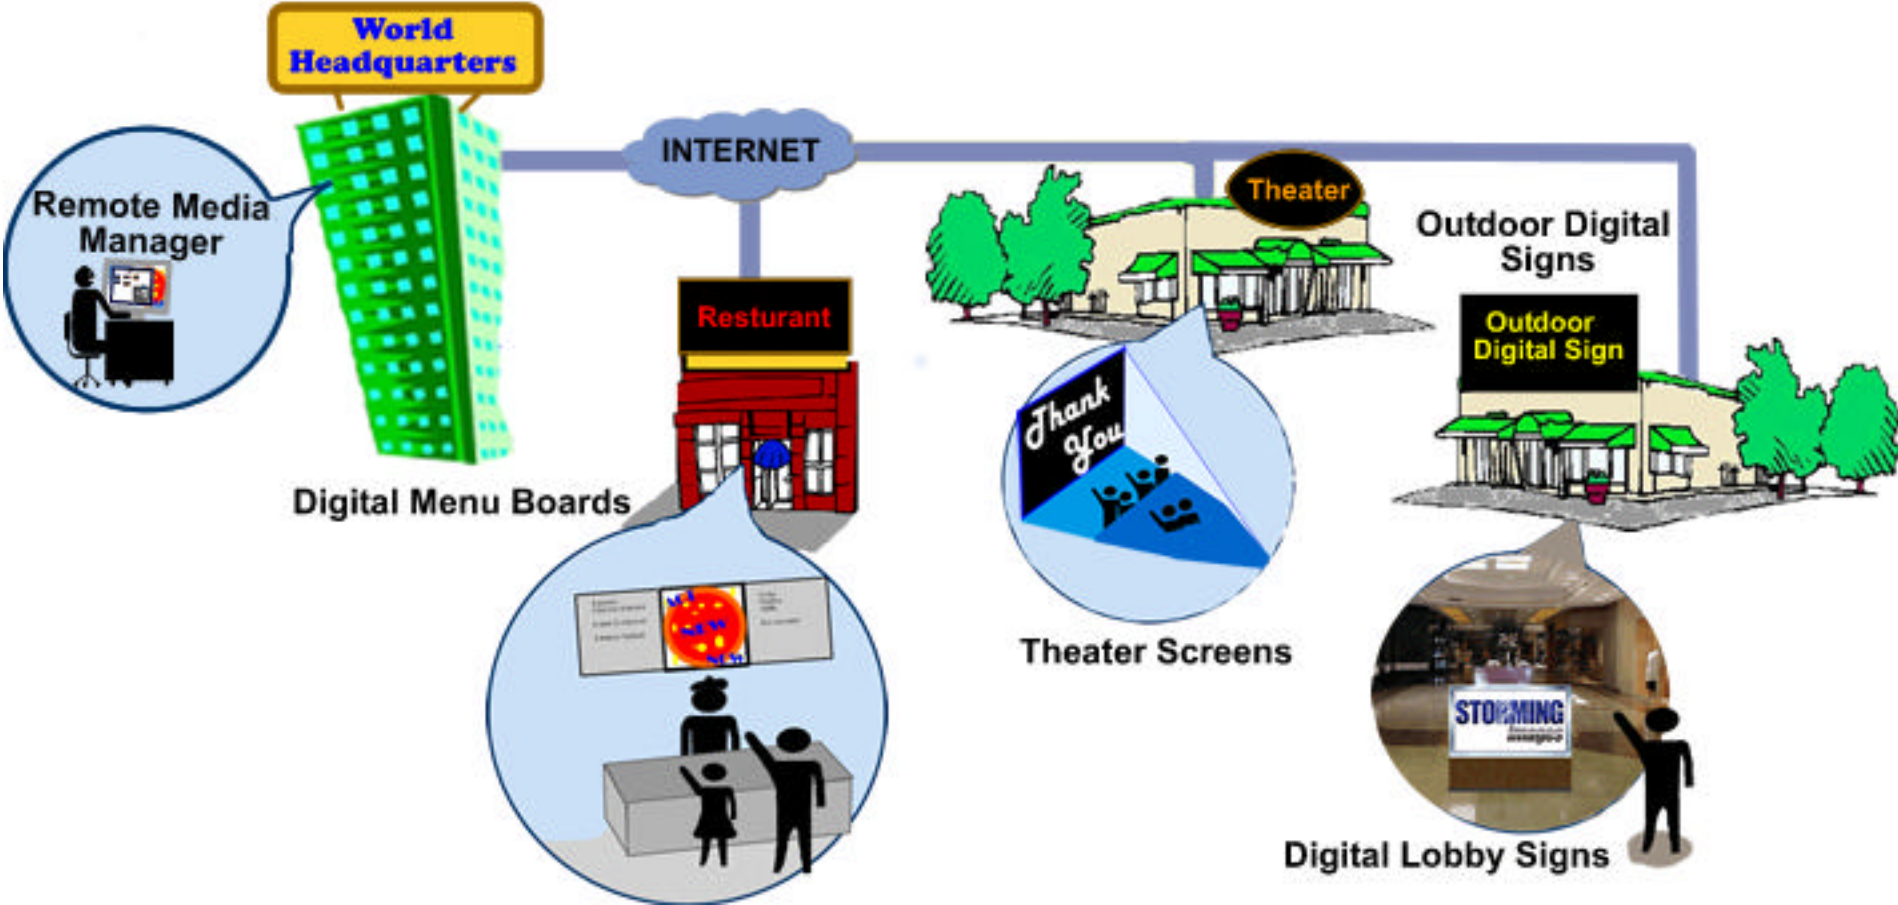

The Remote Media Manager is unique because it has the capability of interfacing with other digital display networks, which means one program can control any system.

Storming Images charges a monthly fee for the use of the Remote Media Manager. If you currently do not have a media playback system, our Admachine hardware is available for purchase.
